**Nakanya Magby:** We all have local school climate data, but we do not always have the opportunities to dig deep into that data. The School Climate Data Use Peer Network for County Offices of Education provides an opportunity for county offices to partner with the California Center for school climate to strengthen their existing efforts.

Together, we will examine shared school climate issues to explore available climate data that can be used to support school climate improvement efforts, build capacity for COE staff to support districts school climate improvement practices, and share best practices in supporting districts to address school climate.

Each county office team will bring together three to four individuals to work closely with CCSC coaches to guide the yearlong partnership. In this work we will identify school climate assets and opportunities for school climate improvement based upon the data, make connections to the LCAP and other improvement plans, and support existing LEA school climate initiatives.

The events for the school climate data use peer network include a one-hour check in call with individual county offices to explore strengths, needs and an area of focus; a ninety-minute virtual kick off session with all COEs to provide an overview of the Peer Network, an opportunity for county offices to meet, and a space to answer questions related to the peer network. County offices will also have the opportunity to share areas of focus. There will be four, 90-minute virtual peer network sessions with other participating county offices. Topics in these sessions are based on input received from COE’s. And lastly, two thought partnership sessions with a CCSC coach.

This support is free to California County Offices of Education through the California Center for School Climate an initiate of the California Department of education operated by WestEd.
